Full Stack Developement

How meta of you ;)

This personal website is to showcase some skills and accomplishments I have, and to practice some new ones. It uses node/express backend with a mySQL database connection and React front end. This readme is available as a description of this website and how to use it. And will also show up as a pdf on the github repo page as popup description.

Getting Started

Download the project and install the dependencies. After everything is installed you can start all 3 servers (React, Node/Express, and MySQL) by running "npm run dev" in the node_app folder. You will need your own password files, which I reference in my code, but obviously haven't included.

Prerequisites

MySQL, node, react. For more dependencies, check out the package.json files:

[Node package.json](#)

[React \(client\) package.json](#)

Deployment
